4-channel 16-bit ADC converter

Built-in 2V5 reference voltage

The 4-20mA measured a voltage by a 120Ω resistor to ground, sampled by ADC channel 0.

The 0-10V is measured through a voltage divider consisting of 10 KΩ (top) and 39 KΩ (bottom), sampled by ADC channel 1.

The NTC is measured by a voltage divider circuit, configured with a 100kΩ resistor and powered by an internal 2.5V reference, sampled by ADC channel 2.

The last ADC channel connect the reference voltage.

ADC-INT: Soldering to enable the ADC-INT function
